CMMB Haiti Recruitment Team

*Catholic Medical Mission Board — Haiti
Autoroute de Delmas, Delmas 71, Port-au-Prince
Position: Monitoring & Evaluation Officer*

August 29, 2026

Dear Hiring Manager,

I am writing to apply for the position of Monitoring and Evaluation Officer at CMMB Haiti. For three years I was M&E Officer on an HIV program at Caris Foundation International, where I ran the routine reporting of multi-site clinics and reported MER indicators to USAID through DATIM, PEPFAR's DHIS2-based platform. Alongside that I work as a data engineer, administering the databases and collection systems that this kind of reporting rests on. The posting asks for both halves of that, and I can offer both. I live in Port-au-Prince, I work in French, English, and Haitian Creole every day, and I am available to travel for site visits to health facilities.

The monitoring half is work I have already done on the schedule you describe. At Caris I consolidated facility data on a fixed reporting calendar, and what made those figures defensible was Data Quality Assessment: take an indicator, walk it back from the published report to the source register, confirm it reconstitutes, then follow the corrective action until it is closed rather than merely recorded. I established and supervised those protocols on MySQL-integrated data across sites — the same discipline I would bring to your monthly, quarterly, semiannual and annual cycles.

One lesson from that work shapes how I would handle facility reporting here. Early in my career I produced a regional average that treated non-reporting sites as zeros. The number was plausible, it triggered no alert, and it was badly wrong. Since then I have applied two rules without exception: a missing value is never a zero, and no indicator is published without the completeness rate it rests on. Writing that an indicator stands at seventy-six percent, calculated on three hundred and fifty-three of three hundred and sixty expected reports, costs five words and changes what a facility manager can actually do with the figure.

The HMIS half is where I expect to be genuinely useful rather than merely adequate. Supporting IT infrastructure for data-management tools, pushing the current version out to every site, reporting bugs, documenting the technical failures that leave a facility unable to reach its system and its reporting in backlog — these are engineering problems, and they are the ones I solve professionally. I have administered relational databases under concurrent access, resolved the failures that make a system unusable in the field, and built the secure services and role-based access controls around them. I know what the national system is: SISNU, on DHIS2, across the ten departments and more than eight hundred facilities. Keeping a database deployed, enhanced and functioning is not an aspiration for me; it is my other job.

Those halves meet in the part of the posting I find most interesting: building data culture at the facilities themselves. I have trained field agents on ODK, KoboToolbox and CommCare, administered the systems behind them, written the technical guides that outlast the training, and automated quality checks in Python and SQL — because a control redone by hand every month eventually stops being done at all. As an Applied Economist by training I can also carry an analysis from sampling through to a trend, then state plainly to a facility team what it means, what remains uncertain, and what decision it should prompt.

I am drawn to CMMB because it has been present in Haiti since 1912, because Haiti is its largest country office, and because it works alongside the MSP and the departmental health directorates rather than around them. My own sector experience sits close to yours: Caris Foundation led the consortium in which CMMB delivered *Projet Santé* in the North, and the HIV reporting I handled there is the same reporting your PEPFAR-supported services generate. I would be glad to bring that to a faith-based organization whose stated purpose is bringing healthcare closer to home. Thank you for considering my application; I would welcome the opportunity to discuss it with you.

Sincerely,

Alexandro Disla
